DISSERTATION ABSTRACT

My dissertation examines what philosophers can learn from agent-based models: Computer simulations that show how simple interactions can produce surprising group-level outcomes. I argue that these models can clarify mechanisms, test assumptions, and establish philosophical possibilities, but only when their conclusions are matched to what the models actually support. Through three case studies, two in social epistemology and one in the philosophy of religion, I show both the promise and the limits of using models in philosophical argument.
